INTRODUCTION

1-1. Purpose. This pamphlet is authorized by and established in accordance with Federal Acquisition Regulation (FAR) 31.105 and Engineer Federal Acquisition Regulation (EFAR) SUBPART 31.105. This pamphlet establishes predetermined equipment ownership and operating expense rates for construction and marine equipment. Expense factors for dredges and attendant plant are provided for use in the development of rates associated with this type of equipment.

1-2. Applicability. This pamphlet applies to HQUSACE/OCE elements, major subordinate commands, districts, laboratories, and field operating activities. It is applicable to all solicitations and contracts for construction expected to exceed $25,000 when actual cost data for both ownership and operating costs cannot be determined. This volume is for use in Region I which includes the following states:

New Mexico

Oklahoma

Texas

1-3. References. See APPENDIX A, References.

1-4. Use. The use of this pamphlet for rate determination on construction contracts, dredging contracts, and negotiated procurements relates only to equipment which is contractor-owned.

a. This pamphlet shall be used for determining hourly equipment rates which are contained in the independent government estimate (IGE).

b. In addition, the use of this pamphlet will be required by contractors for pricing contractor-owned equipment in negotiated procurements when:

(1) Cost or pricing data as defined in FAR 15.8 is not required.

(2) Cost or pricing data is required and the actual cost data to support either ownership or operating costs for equipment or equipment groups of similar model and series is not available.

(3) Cost or pricing data is required and available, but all or part of the data is determined not to be in accordance with the cost principles of the FAR.

1-5. Assistance. If assistance is required understanding the methodology or calculating equipment rates, contact the Chief, Cost Engineering Branch, CENPW-EN-CB, Corps of Engineers, Walla Walla District, phone (509) 527-7511 or (509) 527-7510. The district can also provide the computer software program CHECKRATE (1993 version) for use in expediting construction and dredging equipment rate calculations. There is a nominal charge to non-government users for this software.

CHAPTER 2

METHODOLOGY FOR CONSTRUCTION EQUIPMENT

SECTION I. GENERAL

2-1. Contents. This chapter provides the methodology used to compute the total hourly ownership and operating rates for construction equipment and marine equipment (except dredging plant). This detailed methodology includes the formulas and factors used to develop both total hourly rates and hourly standby rates. If the equipment is determined to be older than its estimated economic life (overage) or was purchased used, refer to Chapter 3, Adjustments to Rates.

2-2. Basis for Equipment Rates. Hourly rates as shown in TABLE 2-1, Hourly Equipment Ownership and Operating Expense, reflect equipment prices based on 1 July 1992 as the date of purchase. Area factors used to compute regional ownership and operating expenses are listed in APPENDIX B, Area Factors. This hourly rate methodology assumes that equipment furnished to the job is in sound, workable condition. Furthermore, the methodology applies only to that equipment which prime contractors or subcontractors either own or control. These hourly rates and cost factors do not represent rental charges for those in the business of renting equipment.

2-3. Total Hourly Rate. Total hourly rates for average conditions shown in TABLE 2-1 are computed on the basis of a 40-hour work week. This total rate is the sum of ownership cost and operating cost. TABLE 2-2, Hourly Rate Elements, contains all individual rate elements for both average and severe conditions. An example of the methodology used to compute the total hourly rate is shown in Figure 2-1. For standby calculation, see Section IX. Standby Hourly Rate.

a. Ownership Cost Elements. The ownership portion of the rate consists of an allowance for depreciation and facilities capital cost of money (FCCM).

b. Operating Cost Elements. Operating costs include allowances for the following:

(1) Fuel
(2) Filters, oil, and grease (FOG) (includes servicing)
(3) Repairs, which include maintenance and major overhauls
(4) Tire wear (replacement)
(5) Tire repair

c. Exclusions to Hourly Rates. Total hourly rates include all elements of cost for owning and operating equipment except the following:

(1) Operating labor
(2) Mobilization and demobilization
(3) Field office overhead expenses
(4) Home office or G&A overhead expenses

(5) Investment tax credit
(6) Contingency allowance
(7) Profit
(8) Other elements of cost as listed in **paragraph 2-19**

It should also be noted that replacement cost escalation is not included in the rates as it is not an allowable item of cost per FAR 31.105(d).

SECTION II. OPERATING CONDITIONS

2-4. Average, Difficult, or Severe Condition. Operating conditions may be average, difficult, or severe. Rates for both average and severe operating conditions are determined in accordance with APPENDIX C, Guide for Selecting Operating Conditions. Difficult conditions are the arithmetic mean of average and severe rates. If only the average rate is shown in TABLE 2-2, that rate will apply for all operating conditions. Average condition rates are included in both TABLE 2-1 and TABLE 2-2. Only TABLE 2-2 contains the severe condition rates.

2-5. Determination of Condition. For contract modifications the contracting officer determines the equipment operating condition to be used based on the contract specifications, the basis of any supporting evidence, and APPENDIX C guidance. Evaluation of operating conditions for equipment not listed in APPENDIX C will be consistent with examples shown in APPENDIX C. The operating condition of the equipment relates to the average and severe factors as detailed in APPENDIX D, Equipment Hourly Expense Calculation Factors.

SECTION III. EQUIPMENT SELECTION

2-6. General. Equipment shown in TABLE 2-1 is representative of equipment that is used in general construction. Note that some equipment may require additional attachments or accessories.

2-7. Truck Selection. Because of the large number of possible combinations of highway truck chassis and bodies, both are listed separately. For estimating purposes, use the gross vehicle weight (GVW) rating of the truck chassis to make a selection, with the following conditions:

a. The combined weight of the truck chassis, truck body, and payload must not exceed the GVW rating shown for the truck chassis.

b. The gross combined weight (GCW) of the truck, trailer, and payload must not exceed the GCW rating shown.

2-8. Crawler Tractor Selection. Because of the various number of blade and ripper combinations available for each crawler tractor, the tractors and attachments may be shown separately. Only the hourly expense for those attachments that are required to perform the work shall be allowed. It should be noted that some makes and models of crawler tractors include the blade attachment while others require all attachments to be added separately.

2-9. Equipment Accessories. Equipment accessories included on the major pieces of equipment in TABLE 2-1 are listed in APPENDIX J, Equipment Accessories.

SECTION IV. EQUIPMENT VALUE

2-10. List Price + Accessories. Equipment rates in TABLE 2-1 are based on three-year old equipment. The 1995 pamphlet uses costs based on the total catalog list price for equipment manufactured in 1992. The total list price includes those accessories normally purchased by the contractor plus required safety features. Some units of equipment may no longer be manufactured; they will continue to be included in the pamphlet as representative models until equivalent replacement units can be identified.

2-11. Discount Code. A 7.5 percent discount is taken on the total list price plus accessories for all equipment except highway trucks which are discounted 15.0 percent. The identification of the discount is shown in APPENDIX D under column heading DC (Discount Code), where B equals the basic discount of 7.50 percent and S equals the special discount of 15.0 percent.

2-12. Sales or Import Tax. Total state sales tax (which includes local taxes) or import tax is computed as a percentage of the discounted price. The amount of tax is given in APPENDIX B.

2-13. Freight. Estimated allowances for freight are given in APPENDIX B. This allowance includes preparation and delivery. Multiply the shipping weight based on hundred weight (CWT) by the freight rate to determine freight charges.

2-14. Total Equipment Value (TEV). Freight is added to the total discounted price (which includes sales tax) to arrive at the TEV. The estimated TEV is indicated in TABLE 2-1 under the column heading VALUE. When developing equipment rates for contract modifications, use the actual equipment price if it is known.

SECTION V. LIFE

2-15. Economic Life. LIFE is the expected economic life of the equipment and will vary based on the type of equipment and the condition of use. It is established from manufacturers' or equipment associations' recommendations. The expected economic life in hours is given in APPENDIX D, under the column heading LIFE, for both average and severe conditions.

2-16. Working Hours Per Year. Annual average operating hours have been established for equipment working within the region covered by this pamphlet. The number of working hours per year (WHPY) as shown in APPENDIX B is equivalent to one year's use for a single shift operation. Average hours of use per year are determined by reducing the maximum available hours per year (40 hours per week, 52 weeks per year) to allow for lost working days due to the following factors:

a. Weather
b. Employee holidays
c. Equipment maintenance and repairs

d. Mobilization and demobilization

e. Miscellaneous downtime.

SECTION VI. SALVAGE VALUE

2-17. Salvage Value (SLV). Salvage values for equipment are based on the Green Guide for Construction Equipment, Handbook of New and Used Construction Equipment Values, and advertisements of used equipment for sale as displayed in current engineering and construction magazines.

2-18. Salvage Value Percentages. The salvage value percentage used for each type of equipment is listed in APPENDIX D under the heading SLV as a percentage of the equipment value. It is equal for both average condition and severe condition.

SECTION VII. OWNERSHIP COST

2-19. Ownership Elements. The ownership portion of the rate consists of allowances for depreciation (DEPR) and Facilities Capital Cost of Money (FCCM). These two cost elements are computed based on the total equipment value. Other ownership elements may be allowed (see paragraph 2-22). Total ownership rate per hour is expressed by formula, as follows:

$$\text{Ownership Rate/Hour} = \text{DEPR/Hour} + \text{FCCM/Hour}$$

2-20. Depreciation. The straight-line method is used to compute depreciation.

a. For rubber-tired equipment the tire cost index (TCI) must first be established to complete the depreciation formula in the sample worksheet.

b. Depreciation Calculation. Depreciation is calculated by dividing the "depreciable" value (total equipment value less estimated salvage and tire cost) by the expected economic life of the unit of equipment in hours. Expressed by formula, depreciation cost equals the following:

$$\text{DEPR/Hr} = \frac{[[(\text{TEV})\,(1-\text{SLV})] - [(\text{TCI})(\text{Tire Cost})]]}{\text{LIFE}}$$

where:

(1) Total equipment value (TEV) - see TABLE 2-1

(2) Salvage value (SLV) - see APPENDIX D

(3) Tire cost index (TCI). Tire and conveyor belt cost is considered to be an operating expense and is subtracted from the total equipment value before computing depreciation. If tire costs based on the date of equipment manufacture are not known, current tire values are modified using the TCI. The TCI is determined by dividing the year-of-manufacture tire index by present-year tire index. These indexes are listed as part of APPENDIX E, Economic Indexes for Construction Equipment (see EK100, All Tires and Tubes).

(4) Tire cost. The tire cost for rubber-tired equipment is based on tire values taken at the time the equipment was manufactured. Estimated values for tires and conveyor belting are provided in APPENDIX F, Tire Description and Tire Cost (this data is provided for information only). Since APPENDIX F does not contain pricing information for all types and sizes of tires and belts, dealers should be contacted for any additional information.

(5) LIFE. LIFE is based on the number of operating hours throughout the economic life of the equipment (see paragraph 2-15). Hours for LIFE are provided in APPENDIX D.

2-21. Facilities Capital Cost of Money

a. Facilities Capital Cost of Money (FCCM), as defined in FAR 15.903, FAR 31.205-10, and CAS 414, is included in the total hourly rates. This cost was computed by multiplying the January 1995 cost-of-money rate (8.125%) determined by the Secretary of the Treasury pursuant to P.L. 92-41 (85 Stat. 97) by the average value of equipment and prorating the result over the annual operating hours. This cost-of-money rate was reduced 25.0% to 6.50% to avoid duplication when applying estimated markups for overhead and profit. The Department of the Treasury adjusts the cost-of-money rate on or about 1 January and 1 July each year; these revisions are printed in the Federal Register. Expressed by formula, FCCM cost equals the following:

$$\text{FCCM/Hr} = \frac{(\text{TEV})\,(\text{AVF})\,(6.50\%)}{(\text{WHPY})}$$

where:

(1) AVF = Average value factor, or
AVF =[[(N-1) (1 + SLV)] + 2] / 2N

(2) N = Number of years in depreciation period, or
N = LIFE / WHPY

(3) 6.50% = Current cost-of-money rate (8.125%) / 1.25

2-22. Other Ownership Elements. The following elements of cost are allowable but would normally be included in the contractor's field office or home office overhead rate calculation.

a. License fees, property taxes, storage, and insurance costs are considered indirect costs and are not included in the total hourly rates.

b. Jobsite security, inspection fees, record-keeping, mechanic's training, and highway permits are also excluded from the total hourly rate for each unit of equipment.

SECTION VIII. OPERATING COST

2-23. Operating Cost Elements. The total operating cost is the sum of the following five elements: fuel, FOG (filters, oil, and grease), repairs, tire wear, and tire repair.

2-24. Fuel Cost. Fuel costs are computed for each gas, diesel, or electric engine. If the unit of equipment has two engines, as in the case of a truck crane, this methodology treats each engine separately for fuel costs. Fuel costs are calculated for each engine, as expressed in the following formula:

Fuel Cost/Hr = Fuel Factor x Horsepower x Fuel Cost/Gallon

a. Hourly Fuel Costs. The estimated hourly fuel cost for each unit of equipment is shown under the column heading FUEL in TABLE 2-1 and TABLE 2-2. If the unit of equipment has no engine, no fuel cost will be shown. See Chapter 3 for fuel adjustments.

b. Fuel Factor - Gas or Diesel Fuel. The fuel factor in gallons per bhp (brake horsepower) hour is listed in APPENDIX D for both average and severe conditions. Fuel factors are also listed for both equipment, prime engine, and the carrier engine. For severe conditions the fuel consumption rate is 30 percent greater than the average conditions rate. Compute gas or diesel fuel factors by using the following formula:

$$\text{Fuel Factor (Gal/bhp-hr)} = \frac{\text{HPF x lbs. Fuel per bhp-hr}}{\text{lbs of Fuel per Gallon}}$$

where:

(1) Bhp is the net brake horsepower of the engine at the flywheel at sea level and at full-load governed speed. The engine is fully equipped with generator, fan, air cleaner, and other regular equipment. All horsepower ratings for engine-driven equipment are listed with the equipment description in TABLE 2-1.

(2) HPF is the horsepower factor used in the fuel and electricity consumption formulas and represents the average percent of full rated horsepower being utilized by the engine. It is necessary to modify the rated horsepower as engines and motors in actual production do not work at their full-rated horsepower at all times. The fuel consumption factors, which are shown in APPENDIX D under column headings Fuel Factor-Equipment and Fuel Factor-Carrier, are computed to include the HPF which is shown for information only.

(3) Lbs. Fuel (consumed) per bhp-hr is based on the following estimate:
gasoline = 0.62 lbs. per bhp-hr
diesel = 0.39 lbs. per bhp-hr

(4) Fuel weight per gallon is based on the following estimate:
gasoline = 6.00 lbs. per gallon
diesel = 7.00 lbs. per gallon

c. Fuel factor- Electricity. Assuming that an electric motor uses 1 kW/hp (considering all inefficiencies), and using the same HPF for gas or diesel fuel consumption, the electricity consumption is computed by the following formula:

Fuel Factor (kW/Hr) = HPF x 1 kW per electric hp hour

d. Fuel and Electricity Costs. The cost per gallon for gasoline and diesel fuel used to compute the hourly fuel costs are shown in APPENDIX B. The hourly fuel costs for all gasoline powered equipment, diesel powered highway trucks, and truck crane carriers include an allowance for federal and state road taxes, sales taxes, and rental for fuel storage tanks and pumps. Costs per kilowatt hour for electricity used to compute electricity costs are also shown in APPENDIX B.

2-25. Filter, Oil, and Grease (FOG) Cost. FOG cost is computed as a percentage of the hourly fuel costs.

a. The FOG element contains all items of cost for routine servicing of the equipment including the following:

(1) Base wages for servicing labor
(2) Fringe benefits and labor burden costs for servicing
(3) Service truck and fuel truck allowance
(4) Other equipment costs for servicing
(5) Filters, oil, and grease allowance
(6) Taxes and shipping for FOG supplies

b. Fog cost is calculated for each engine using the following formula:

Fog Cost / Hr = FOG Factor x Fuel Cost/Hr x LAF

where:

Fog Factor = These are percent allowances expressed as a decimal factors under each fuel type heading: E (electricity), G (gas), or D (diesel). See APPENDIX D.

Fuel Cost/Hr = Refer to paragraph 2-24.

LAF (Labor Adjustment Factor) = This is a decimal factor used to adjust the FOG factor to account for regional variations in labor and parts costs. This factor is provided in APPENDIX B. LAF is also used to adjust the repair factor (RF) and the tire repair cost.

c. The FOG percentage allowance is reduced for servicing which is normally performed by the oiler who is assigned separately to the unit of equipment (and costed elsewhere). This reduction applies to the following equipment: cranes, draglines, hydraulic excavators, and shovels (except equipment under category numbers C75, C80.01, C85.11, C85.12, C85.21, C90.01, H25.11, H25.12, H30.01, H30.02, and M10.32)

d. An hourly FOG allowance may need to be added under the following circumstances: (1) The unit of equipment has no engine (therefore no fuel costs), and (2) the equipment has parts that require a FOG allowance. This reasonable allowance is included in the FOG hourly rates where appropriate.

2-26. Repair Cost. The repair cost is an allowance for equipment repairs, maintenance, and major overhauls (including undercarriage wear) performed in either the field or the shop. Where tire cost is the cost of the tires when the equipment was manufactured, use the same TCI and tire cost as shown in the depreciation calculation (see paragraph 2-20). The estimated hourly rate for repairs is computed as follows:

$$\text{Repair Cost/Hr} = \frac{[(\text{TEV})-[(\text{TCI})(\text{Tire Cost})]] \times \text{Repair Factor}}{\text{LIFE}}$$

a. Repair Factor. The repair factor is calculated as follows:

Repair Factor (RF) = Repair cost factor (RPR) x EAF x LAF

b. Use the following multiplying factors to develop the repair factor:

(1) The estimated repair cost factor (RPR) is shown in APPENDIX D. This factor varies depending on the operating condition of the equipment (average or severe).

(2) The economic adjustment factor (EAF) is used to adjust the repair cost factor to current price levels. The EAF is equal to the economic index for the present year divided by the economic index for the year the equipment was manufactured. APPENDIX E, Economic Indexes for Construction Equipment, is used to develop the EAF. Economic indexes are determined as follows:

(a) Economic Index for the Present Year. Find the present year and corresponding index in APPENDIX E for the equipment division in question. If the index for the present year has not been included, future year indexes can be estimated using a straight-line projection.

(b) Economic Index for the Year of Manufacture. This is the economic index for the year the equipment was manufactured (can be determined from equipment serial numbers). Locate the index number in APPENDIX E for the year and equipment division. If the actual age of the equipment is beyond the last year of its economic life (overage), refer to Chapter 3 for further rate adjustments.

c. Items Included in the Repair Cost Factor. The estimated percentage allowances for the repair cost factor are shown in APPENDIX D under the column heading RPR and are expressed as decimal factors. These repair cost factors (for both the average and severe conditions) compensate for the following cost elements:

(1) Mechanic's labor includes base wages, fringe benefits, supervision, and all other costs for labor associated with craft workers engaged in the direct repair of equipment.

(2) Repair parts and supplies includes those items which are required for all repairs and major overhauls complete with applicable sales taxes and freight charges.

(3) Service trucks and other equipment utilized during repair and maintenance work, including tools.

(4) Supporting repair facilities includes field and main repair shops complete with parts and supplies inventory, and shop overhead.

2-27. Tire Cost. Tires included on rubber-tired equipment are generally the type and ply rating recommended as standard tires by the equipment manufacturer. Tire costs include both tire wear (replacement) and tire repair as individual elements of cost. Conveyor belt wear is also included under this cost element.

a. Tire Wear Cost. The formula for calculating tire wear applies to each tire position: front (FT), drive (DT), and trailing (TT). However, all tires performing the drive function are considered as drive tires and are listed in the DT position. The total hourly tire wear cost for each unit of equipment is the sum of the hourly cost for each position. The hourly tire wear cost equals the current cost of new tires plus the cost of one recapping divided by the expected life of the new tires plus the life of the recapped tires. This hourly allowance for determining tire wear cost is expressed in the following formula:

$$\frac{\text{Tire Cost Factor x Current Tire Cost}}{\text{Tire Life Factor x Tire Wear Factor x Maximum Tire Life}}$$

where:

(1) Tire cost factor. It has been estimated that a recap costs approximately 50 percent of the new tire cost. Therefore, tire cost factor is 1.50, which represents the purchase of the original tire plus 1 recap.

(2) Current tire cost. The estimated current tire cost applies to all tires on the equipment in that position. For example, 4 new drive tires valued at $500 each would result in an amount of $2,000 for total drive tire cost. The size and cost of each tire used in the pamphlet are listed for information in APPENDIX F.

(3) Tire life factor. It has been estimated that a recap lasts approximately 80 percent of the life of a new tire. Therefore, total initial tire life factor is 1.80, which represents the purchase of the original tire plus 1 recap.

(4) Tire wear factor. Based on the position of the tire, type of equipment, and condition of use, tire wear factors have been developed and are listed in APPENDIX D. These factors will provide a percentage reduction to the maximum tire life. APPENDIX G, Tire Life and Tire Wear Factors, contains the methodology used to develop these factors and a computation example for a rear dump wagon.

(5) Maximum tire life. The maximum new tire life for various tire types is shown in APPENDIX G. It is expressed in hours in the above formula. The useful tire life is estimated using the method and tables in "Production and Cost Estimating of Material Movement with Earthmoving Equipment" prepared by Terex Division of General Motors.

b. Tire Repair Cost. It has been estimated that tire repairs are 15 percent of the total hourly tire wear cost. LAF is used to adjust the tire repair cost to account for regional variations in labor and

parts costs. This cost element has been calculated and listed separately in TABLE 2-2. It is expressed as a formula as follows:

Tire Repair Cost = Total Tire Wear Cost x .15 x LAF

c. Belt Cost. For equipment that uses conveyor belts, the belt wear is treated similarly to tire wear. The wear factors are listed in the front tire wear factor column in APPENDIX D. Belt life is shown in APPENDIX G and belt cost is listed in APPENDIX F.

SECTION IX. STANDBY HOURLY RATE

2-28. Standby Hourly Rate. The standby rate is computed from the average condition by allowing the full FCCM hourly cost plus one-half of the hourly depreciation. It is expressed as a formula, as follows:

Standby Rate/Hr = (DEPR/Hr x .50) + FCCM/Hr

a. Paid standby shall not exceed 40 hours per week (7 calendar days) per unit of equipment.

b. Standby will not be allowed during periods when the equipment would have otherwise been in idle status. Actual operating hours during a week will be credited against the 40 hours maximum standby allowance.

c. When the equipment is purchased used, standby will be computed on the basis that the equipment was purchased new by the contractor in the year it was manufactured. If the equipment is average, the adjustments identified in Chapter 3 shall be used.

SECTION X. RATE CALCULATION EXAMPLE

2-29. Computation Example. Figure 2-1, Equipment Rate Computation Worksheet, is an example of how the total hourly rates in TABLE 2-1 are computed.

a. When an hourly rate for a specific unit of equipment not included in this pamphlet must be computed, the methodology contained in Chapter 2 shall be followed. Software is also available for rate computation (see Chapter 1).

b. See Chapter 3, Adjustments to Rates, for further guidance on the procedure for rate adjustments.

Use this worksheet to compute rates for equipment that is not in this pamphlet.

TABLE 2-1

HOURLY EQUIPMENT OWNERSHIP AND OPERATING EXPENSE

EXPLANATION OF TABLE HEADINGS

Example unit of equipment: American Crane, Model 5530, 75 Ton, 170-boom. (Based on average condition.)

CAT: C90 is the category number and identifies for Mechanical Cranes,Truck-Mounted (see APPENDIX D).

ID NO.: C90AM001 is the unique identification number for the above American Crane. AM equals the manufacturer (see APPENDIX H, Manufacturer Codes). 001 equals the numeric order of this unit of equipment within the manufacturer's listing.

MODEL: 5530 is the equipment model number.

EQUIPMENT DESCRIPTION: Specific information for each particular unit of equipment is described, such as "75 ton with a 170-foot boom" for the American Crane. The amount of horsepower and type of fuel used is stated. The American Crane carrier has a 238-horsepower engine and the crane has a 128-horsepower engine. Both engines are diesel (D)

VALUE (TEV): This column reflects the predetermined "equipment cost" used to compute the rates and is based on equipment purchased new in 1992.

TOTAL HOURLY RATES: All ownership and operating expenses for the average condition are included. All cost elements including fuel are totaled in the AVERAGE column. The STANDBY column includes the hourly allowance for equipment on legitimate standby status.

ADJUSTABLE ELEMENTS. This column shows ownership elements and fuel costs broken out of the AVERAGE column so they can be adjusted as indicated in Chapter 3. Operating costs may be determined by subtracting the ownership cost elements (DEPR plus FCCM) from the total hourly rate for the average condition. Fuel price adjustments can be performed to the total hourly cost shown under the FUEL column.

CWT: The shipping weight of the equipment is stated in hundredweight.

CHAPTER 3

ADJUSTMENTS TO HOURLY RATES

SECTION I. CONTENTS

3-1. Contents. This chapter explains the procedures for adjusting the hourly rates as shown in TABLE 2-1. These rates are based on equipment with a 3-year-old life and on area factors as shown in APPENDIX B. TABLE 3-1, Equipment Rate Adjustments for Ownership Costs and TABLE 3-2, Equipment Rate Adjustments for Standby Costs have been developed to make adjustments to TABLE 2-1 hour rates. Hourly rates for construction equipment for both average and severe conditions are given in TABLE 2-2, Hourly Rate Elements.

SECTION II. RATE ADJUSTMENTS

3-2. Use of Rate Adjustment Tables.

a. These tables may be used when the actual unit of equipment is known, as in the case of most negotiated procurements. These tables provide reasonable adjustment factors to allow a shortcut method for adjusting an hourly rate when actual conditions are considered, as in the case of contract modifications.

b. The rate adjustment tables may be used in lieu of a step-by-step rate computation when cost or pricing data is available, provided that the unit of equipment listed in the pamphlet is equivalent in size, capacity, and horsepower to the contractor's actual unit of equipment.

c. Individual cost elements, which comprise the total hourly rate, are shown in TABLE 2-2. These hourly rate elements are listed by equipment identification number corresponding to each unit of equipment shown in TABLE 2-1.

(1) Operating cost elements consist of fuel (FUEL), filters, oil, and grease (FOG), repairs (RPR), tire wear (TIRE WEAR), and tire repair (TIRE RPR).

(2) Ownership cost elements consist of depreciation (DEPR) and facilities capital cost of money (FCCM). Total ownership (DEPR + FCCM) can be adjusted to account for actual age of the equipment. The hourly ownership elements shown in TABLE 2-2 can be factored for age using TABLE 3-1.

SECTION III. RATE ADJUSTMENT CONDITIONS

3-3. Rate Adjustment Conditions. The ownership hourly rates and standby hourly rates shall be adjusted whenever one or more of the following rate adjustment conditions exist.

3-4. Rate Adjustment for Change in Conditions. If difficult conditions are justified by the contract, adjustments shall be made See Chapter 2, Section II, Operating Conditions for definition of average, difficult, or severe conditions, and determination of condition.

3-5. Rate Adjustment to FCCM Rate if Cost-of-Money Rate is No Longer Current. If the cost-of-money rate shown in Chapter 2 is no longer current, the FCCM portion of the rate shall be adjusted upward or downward to match the cost-of-money rate for the period of use in question. For example, if the cost-of-money rate should increase by 8% (say from 8.50% to 9.35%), then 8% of the hourly FCCM cost (from TABLE 2-2) will be added to the total hourly rate. See APPENDIX I, Federal Cost-of-Money Rate, for a listing of cost-of-money rates.

3-6. Rate Adjustment if Actual Hours Work Exceeds 40 Hours per Week. If the actual number of work hours per week is greater than 40 hours, an adjustment shall be made to the ownership cost. Facilities capital cost of money is to be paid for a maximum of 40 hours per week (7 calendar days). To calculate a multi-shift rate, prorate 40 hours FCCM over the actual hours per week, as follows:

Other Work Shift Hourly Rate =

$$\text{Depreciation/hr} + [\,(\text{FCCM/ hr}) \times \frac{\text{40 hrs/week}}{\text{(actual work hrs/week)}}\,] + \text{Operating Costs}$$

EXAMPLE: Assume that a truck crane is to be worked 10 hours per day, 6 days per week (60 hours per week). The total hourly rate for this piece of equipment can be determined as follows:

Assumptions:

Depreciation/hr	=	$20.00
FCCM /hr	=	$4.00
Operating costs	=	$25.00
		==========
	=	49.00

Calculation:

$$\$20.00 + [\,(\$4.00) \times \frac{\text{40 hrs/week}}{\text{(60 hrs/week)}}\,] + \$25.00 = \$47.67$$

3-7. Rate Adjustment if Fuel Costs Change. Hourly fuel costs shall be adjusted in the event the average fuel prices f.o.b. jobsite vary by more than 10 percent above or below the price in APPENDIX B. For example, if the price per gallon should increase by 15 percent, then 15 percent of the hourly fuel cost will be added to the total hourly rate. The contractor shall be required to furnish copies of all fuel supply contracts and invoices to the government to support fuel cost adjustment. Request for upward adjustment in the rates will be considered only when fuel is supplied by recognized distributors. Other factors to be considered are:

a. The hourly FOG allowance shall be adjusted upward or downward in conjunction with any authorized fuel price revisions.

b. There is no rate adjustment for repairs, tire wear, or tire repair.

3-8. Rate Adjustment for Age Other Than Listed in TABLE 2-1. The "Equipment Age Adjustment Factors for Ownership Costs" in TABLE 3-1 are used when the age of a unit of equipment is other than the age of the equipment listed in TABLE 2-1. The hourly ownership costs are multiplied by the factors given in TABLE 3-1 when shown in TABLE 2-1 and result in an ownership rate adjusted for the actual age of the equipment being considered.

EXAMPLE: Assume that Table 2-1 includes a 50-ton truck crane (*category C90.02*), manufactured in 1992, has a total hourly rate of $72.98 per hour and an ownership rate of $27.57 per hour. If an equivalent crane owned by a contractor had been purchased new in 1988, the total hourly rate can be determined as follows:

Assumptions:

Factors are based on the 1995 edition of EP 1110-1-8, for Region 6

Calculation:

Total hourly rate	=	$72.98
Ownership rate	=	($27.57)
Ownership adjusted for age	=	$21.50
(ownership rate = $27.57) x (age adjustment factor = .78)		
		=========
Adjusted total hourly rate	=	$66.91

3-9. Rate Adjustment for Overage Equipment. If the contractor's equipment exceeds the economic life (see Chapter 2, Section V, LIFE) in hours as shown in Appendix D, rates shall be adjusted.

a. The equipment is considered overage when the equipment was manufactured past the service life given in APPENDIX D. If it is overage, the ownership portion of the rate shall be adjusted. This adjusted rate will not exceed the rate for the same unit of equipment that is not overage.

b. The base year for determining overage equipment value is the year corresponding to maximum life. The total hourly operating rate for overage equipment shall be computed on the basis that the equipment is as old as possible without exceeding the LIFE as shown in APPENDIX D. Maximum Life is determined by dividing LIFE (from APPENDIX D) by Working Hours Per Year (WHPY) TABLE 3-1 show factors for the maximum life for equipment based on 1995 rates (the current pamphlet year). If there is no comparable unit of equipment shown in TABLE 2-1, the total hourly rate can be computed as shown in the following the example:

EXAMPLE If an crane owned by a contractor had been purchased new in 1972 and was equivalent to a 50-ton truck crane which was manufactured in 1992, (*category C90.02* = base year for TABLE 2-1), this crane is overage and the total hourly rate can be determined as follows:

Assumptions:
Factors are based on the 1995 edition of EP 1110-1-8, for Region 6

Calculation:

Total hourly rate	=	$72.98
Ownership rate	=	($27.57)
Ownership adjusted for age	=	$20.13
(ownership rate = $27.57) x (oldest age adjustment factor = .73)		
		======
Adjusted total hourly rate	=	$65.54

NOTE: If an equivalent crane, manufactured in 1972, had been purchased used in 1986 by the contractor, the crane is overage and the rate computation would be identical to the above example.

3-10. Rate Adjustments if a Standby Rate is Required. There is no overage for standby. Age of the equipment shall be based on manufacturer year. Age adjustment factors are listed in TABLE 3-2, Equipment Age Adjustment Factors for Standby Costs, for factoring the standby rate shown in TABLE 2-1. The factors given in TABLE 3-2 are multiplied by the hourly standby costs shown in TABLE 2-1 and result in a standby rate adjusted for the actual age of the unit of equipment being considered.

EXAMPLE: Assume that a 50-ton crane (manufactured in 1992) listed in TABLE 2-1 has an hourly standby rate of $18.00 per hour. If an equivalent crane owned by a contractor had been purchased new in 1987, the hourly standby rate can be determined as follows:

Hourly Standby rate (per hour)	=	$18.00

Calculation:

Standby adjusted for age (per hour)	=	$13.86

(Standby rate = $18.00) x (Age adjustment factor = .77)

3-11. Adjustments to Rates for a Unit of Equipment Not Listed in TABLE 2-1. When a unit of equipment is not listed in TABLE 2-1, the hourly rate may be determined by using the hourly rate listed for a similar unit of equipment or by proportioning a rate listed so that capacity, size, and horsepower are properly considered. When an hourly rate cannot be determined using TABLE 2-1, rates will be calculated following the methodology outlined in Chapter 2 and the adjustments explained in this chapter.

3-12. Adjustments not Included for Equipment Purchased Used. A detailed methodology for computing a total hourly rate for equipment purchased used is not included in this pamphlet.

a. The condition of the equipment at the time of purchase considers the extent of capital improvements, mechanical condition of drive train, and previous hours of operation. These conditions are difficult or impossible to determine and to evaluate when computing a total hourly rate based on actual acquisition cost.

b. When actual cost data in accordance with Chapter 1 is not available, a total hourly rate and standby rate for equipment purchased used can be computed on the basis that the equipment was purchased new by the contractor in the year it was manufactured. Consideration for the actual age of used equipment may require an adjustment for overage.

3-13. Rate Calculation Example. Figure 3-1, Total Hourly Rate Calculation for Overage Equipment, illustrates how total hourly rates are adjusted for overage equipment. Figure 3-2, Standby Rate Calculation for Overage Equipment, gives a sample calculation for computing adjusted standby rates. Rate software is also available for rate computation (see Chapter 1).

TABLE 3-1

EQUIPMENT AGE ADJUSTMENT FACTORS

FOR

OWNERSHIP COSTS

THE "Equipment Age Adjustment Factors for Ownership Costs" in TABLE 3-1 are used when the age of a unit of equipment is other than the age of the equipment listed in TABLE 2-1.

The factors given in TABLE 3-1 are multiplied by the hourly ownership costs when shown in TABLE 2-1 and result in an ownership rate adjusted for the actual age of the equipment being considered.

When the "life" of the unit of equipment has exceeded the economic life given in APPENDIX D, the age will be determined as discussed in Chapter 3, Adjusments to Hourly Rates

Refer to Chapter 3, as follows:

3-8. Rate Adjustment for Age Other Than Listed in TABLE 2-1.

3-9. Rate Adjustment for Overage Equipment.

TOTAL HOURLY RATE CALCULATION FOR OVERAGE EQUIPMENT

EXAMPLE

Assume the following set of given information for the rate calculation example:

A. **The unit of equipment is not listed in TABLE 2-1**

B. The equipment is contractor-owned

C. Data for the unit in question:

1. Clark front-end wheel loader
2. Model 125B, 4WD, 4 CY capacity
3. Serial number indicates year of manufacture = 1980
4. Actual purchase price was $119,995 in 1980
5. Horsepower is 210 hp
6. Drive tire size = 23.5 x 25, 16 PR, L-3

Drive tire cost = 4 tires x $2,176 = $8,704 (in 1995)

D. TABLE 3-1, Age Adjustment Factors for Ownership Costs:

1. Category L40.11 (wheel loaders < 225 hp)
2. Last age adjustment factor - 1990

E. Adjust the actual purchase price:

1. Index APPENDIX E (wheel loaders EK = 45)
   a. 1990 = 4532 (first year of economic life)
   b. 1980 = 2938 (year of manufacture)
2. Purchase price (TEV) indexed to 1990 (first year of economic life):
   (Purchase price includes discount, sales tax & freight)

   (4532 / 2938) x $119,995 = $185,098 (=1990 purchase price)

TABLE 3-2

EQUIPMENT AGE ADJUSTMENT FACTORS

FOR

STANDBY COSTS

THE "Age Adjustment Factors for Standby Costs" in TABLE 3-2 are used when the age of a unit of equipment is other than the age of the unit of equipment listed in TABLE 2-1.

The factors given in TABLE 3-2 are multiplied by the hourly standby costs shown in TABLE 2-1 and result in an standby rate adjusted for the actual age of the equipment being considered.

When the "life" of the unit of equipment has exceeded the economic service life given in APPENDIX D, the age will be determined as discussed in Chapter 3, Adjusments to Hourly Rates

Refer to Chapter 3, as follows:

3-10. Rate Adjustments if a Standby Rate is Required

STANDBY HOURLY RATE CALCULATION FOR OVERAGE EQUIPMENT

EXAMPLE

Assume the following information for the rate calculation example:

A. **The unit of equipment is not listed in TABLE 2-1**

B. The equipment is contractor-owned

C. Data for the unit in question:

1. Clark front-end wheel loader
2. Model 125B, 4WD, 4 CY capacity
3. Serial number indicates year of manufacture = 1980
4. Actual purchase price was $119,995 in 1980
5. Horsepower is 210 hp
6. Drive tire size = 23.5 x 25, 16 PR, L-3

Drive tire cost = 4 tires x $2,176 = $8,704 (in 1995)

D. TABLE 3-2, Age Adjustment Factors for Standby Costs:

1. The Standby rate is to be based on the actual year of manufacture. No adjustment to the first year of economic life (as used in average hourly age adjustment).

E. Use the actual cost data as follows:

1. Purchase price (TEV) = $119,995
2. Year of manufacture = 1980

F. Hourly rate is computed as follows in accordance with Chapter 3, Rate Adjustments for Standby Hourly Rate Calculation for Overage Equipment.

Figure 3-2. Standby Hourly Rate Calculation for Overage Equipment

Use this worksheet to compute rates for equipment that is not in this pamphlet.

CHAPTER 4

METHODOLOGY FOR DREDGING PLANT

SECTION I. GENERAL

4-1. Contents. This chapter contains the methodology used to compute ownership and operating rates for dredging plant.

4-2. General. The ownership and operating rates provided in TABLE 2-1, Category M-10, are developed based on the methodology in Chapter 2 for non-dredging activities. Those rates may be used for dredging, provided they are adjusted in accordance with the methodology provided in this chapter.

a. Ownership and operating cost factors as shown in TABLE 4-1, Dredge Plant Expense Factors, are for various types of dredging equipment and plant. When a type of equipment or plant is not listed, the cost factors may be estimated by using the factors listed in this table for a similar type of plant.

b. This rate methodology applies only to dredges and floating attendant plant engaged in any type of dredging operations.

c. Hopper dredge cost factors and rate methodology are not included in this chapter. These factors have been omitted primarily due to the limited number of hopper dredges and the complexity of the methodology used to calculate rates. Further information can be found in ER 1110-2-1302, Civil Works Cost Engineering.

SECTION II. ANNUAL USE

4-3. Time Available to Dredge.

a. The number of months available per each calendar year for the contract dredging shall be based on the work time available to dredge, excluding downtime for major repairs, work in dry dock, bad weather, and environmental restrictions. Therefore Figure 4-1, Months Available by Region, depicts estimated months available for dredging, including mobilization and demobilization, and is based on data collected from Corps of Engineers' regional dredge estimating teams. This information shall be used for computing the ownership costs . If the contract document specifies a different time in months, these months may be substituted.

b. The basis for estimating operating hours of use per month must be documented in the estimate by the cost engineer.

MONTHS AVAILABLE TO DREDGE BY REGION

Region	Type of Dredge Operation		
	Pipeline	Bucket	Hopper
Atlantic Coast and tributaries	9	10	10
Gulf Coast, Lower Mississippi and tributaries (below St. Louis)	10	10	11
Great Lakes, Upper Mississippi and tributaries	8	8	8
West Coast and tributaries	9	9	9

Figure 4-1. - Months Available by Region

SECTION III. LIFE

4-4. Life. The life for determining ownership and operating costs is defined as follows:

a. Useful Life. The Useful Life is expressed in years in TABLE 4-1. It is the expected life used to develop ownership rates for various types of dredge plant.

b. Physical Life. The Physical Life is expressed in hours in TABLE 4-1. It is the expected life used to develop operating rates for various types of dredge plant.

4-5. Annual Hours Available. The annual hours available to dredge can be established for each type of plant based on the months available and the estimated effective monthly hours worked. For definition of effective time refer to ER 1110-2-1302, Civil Works Cost Engineering. The total annual hours available can be expressed by formula, as follows:

Available Hours Per Year = Months Available/Year x Effective Hours/Month

SECTION IV. SALVAGE VALUE

4-6. Salvage Value. The salvage value (SLV), expressed as a decimal, is shown in TABLE 4-I for different types of plant.

SECTION V. OWNERSHIP COST

4-7. Ownership Cost. Ownership expense is expressed as a percent of plant value, which is defined as the acquisition cost plus any initial capital improvements. The value of initial capital improvements should be based on those betterments which were made within one year of purchase. Capital improvements should not include any replacement or repair work. For capital improvements not made within the first year after the initial acquisition, see Section VIII, Negotiated Procurement.

a. The ownership rate is determined from the plant value and the total expense rate for depreciation and FCCM. When cost or pricing data is available, the actual acquisition price shall be used. Otherwise, the value of a similar piece of plant is used and, if necessary, adjusted so that capacity, size, and horsepower are properly considered.

b. Ownership expense is determined on an yearly basis using the following formula:

$$\text{Ownership Per Year} = \text{Plant Value} \times (\text{DEPR} + \text{FCCM})$$

where:

DEPR = Ownership percent per year for depreciation

FCCM = Ownership percent per year for Facilities Capital Cost of Money

4-8. Depreciation. Depreciation is computed using the straight-line method. The depreciable value is the acquisition cost, plus initial capital improvements, less estimated salvage. The basis for determining the yearly percentage factor for depreciation is expressed by formula, as follows:

$$\text{DEPR (percent per year)} = (1-\text{SLV}) / \text{N}$$

where:

N = Ownership Life in Years
SLV = Salvage Value

4-9. Facilities Capital Cost of Money. Facilities capital cost of money (FCCM) is computed as shown in Chapter 2, except that FCCM is determined on a yearly basis instead of an hourly basis and is expressed here as an annual percentage factor. The cost-of-money rate (CMR) in effect at the time the work is performed or current rate shall apply. This formula is expressed as follows:

$$\text{FCCM (percent per year)} = \frac{[(N-1)(1+SLV)+2](CMR)}{2N}$$

where:

CMR = Cost-of-money rate reduced by 25.0% for overhead and profit allowance

4-10. Other Ownership Elements. Taxes, storage (lay-up), and insurance are considered indirect (overhead) costs as defined in ER 1110-2-1302, Appendix D. These are not included in ownership rates as calculated in this chapter since they vary by geographic areas and with individual contractors. These costs should not be duplicated in the estimate or submitted proposal.

SECTION VI. OPERATING FACTORS

4-11. Hourly Operating Factors. Dredge plant operating factors are shown in TABLE 4-1. These factors, which are described below, are not intended to replace historical data but may be used when historical data is limited or non-existent.

4-12. Prime and Secondary Power. Prime power refers to the primary operating engine for the dredge or other piece of attendant plant. Secondary power refers to all other secondary engines or power plants. If more than one of these engines is present, the horsepower is totaled. Fuel consumption factors are prepared on the same basis as Chapter 2 If the estimator has more specific fuel consumption information, the horsepower factor (HPF) may be adjusted to reflect job conditions. The HPF factor is shown for information only in non-decimal format.

4-13. Water, Lube, and Supplies (WLS). This factor is similar to the FOG factor described in Chapter 2. This item is computed as either a percentage of the hourly fuel costs or, if the type of plant has no engine, a reasonable hourly cost should be included. This factor does not include an allowance for the oiler normally assigned to the dredge or other piece of dredge plant.

4-14. Repairs (RPR). This factor includes an allowance for all major and minor repairs and is similar to the maintenance and repair cost factor described in Chapter 2. The economic adjustment factor (EAF) and the labor adjustment factor (LAF) are required to develop this cost. It should be noted that the repair allowance does not include the following estimated additive items:

a. Excessive dredge wear for parts such as cutter teeth and main suction pumps are not included due to the wide variety of materials being dredged. Bucket wear for mechanical dredges is estimated as an additive item or treated as a separate unit of equipment from TABLE 2-1. Allowances for wear due to abrasive material should only be included as an additive item if it is warranted and is not considered elsewhere in the estimate.

b. Dry docking costs, which represent an allowance for rental of the dry dock facility, are not included because they vary greatly depending on the facilities available. Repairs incurred while in dry dock, which occur periodically, are in the repair factor (RPR). Dry docking costs will be allocated on an average annual basis over the years between such occurrences (in accordance with FAR 31.205-24).

c. There is no predetermined allowance in the dredge plant methodology for jobsite yard costs, mobilization, or demobilization. All of these cost elements must be separately estimated to match each project's construction conditions.

SECTION VII. STANDBY

4-15. Standby Rate. The standby rate is computed by allowing the full ownership cost (full depreciation plus the full FCCM). In addition to the standby ownership rate, it may be necessary on dredges to include operating costs, such as a generator fuel allowance to account for operation of a diesel engine generator for power to operate pumps, navigation lights, minimum crew, etc.

a. Standby is directed delay by the Government and will not be allowed during periods when the plant would have otherwise been in idle status, such as non-effective time. Since ownership is calculated based on life in years computed monthly and paid on calender time of job. Standby should be paid only when time has been directed by the government. Standby is to be paid on a 24-hour basis.

b. Standby for pipeline and accessories shall be based on pumping mud in determining values from TABLE 4-1.

SECTION VIII. NEGOTIATED PROCUREMENT

4-16. Rates. The calculated plant rates based on the methodology presented in this chapter should be used for preparing a reasonable contract estimate. When adequate cost or pricing data is available and is submitted by the contractor for negotiated procurement, the rates may be adjusted in accordance with the methodology in this chapter. Cost or pricing data is defined in Federal Acquisition Regulation (FAR), Subpart 15.8, Section 15.801, Definitions.

4-17. Allowance for Additional Capital Improvements. Allowance for additional capital improvements shall be calculated in accordance with accepted general accounting principles. When adequate cost or pricing data is not available, factors for a similar unit of equipment may be used for determining the ownership rate for overage equipment and plant.

4-18. Overage Plant

a. When the plant has exceeded the useful life given in TABLE 4-1, it is considered overage. The ownership rate for overage plant should be determined with the same methodology described in SECTION V with useful life as shown in TABLE 4-1.

b. When actual cost or pricing data is available to adjust the operating rate, the data must be adequate and established in accordance with accepted general accounting principles. When actual cost or pricing data is not available the total hourly operating rate for overage equipment shall be computed on the basis that the equipment is equal to the Useful Life as shown in TABLE 4-1.

4-19. Dredge Plant Purchased Used. For plant purchased used, the ownership and operating rate must be calculated on an individual case, due to the varying conditions. When actual cost or pricing data is not available, the methodology from this chapter shall be used and values for life and salvage from TABLE 4-1 can be adjusted. Support for adjustments can be obtained by calling the Chief, Cost Engineering Branch, CENPW-EN-CB, Corps of Engineers, Walla Walla District, phone (509) 527-7511.

SECTION IX. RATE CALCULATION EXAMPLE

4-20. Rate Calculation Example. The following example shown in Figure 4-2, Dredge Plant Ownership and Operating Worksheet, illustrates the use of TABLE 4-1 and the regional data to generate a rate.

a. Ownership is determined by calculating yearly percentages to account for Depreciation and FCCM. Operating costs are determined by utilizing formulas from Chapter 2 for FUEL, FOG (WLS), and REPAIRS.

b. For illustration purposes, assume that a 24" hydraulic dredge was purchased new in 1985 for $3,700,000, including tax and delivery, and there were no initial capital improvements. This example uses 500 hours per month and a reduced cost-of-money rate (CMR) of 6.50%.

6. Ownership Expense Percent per Year

a. Depreciation Percent (%): = (1.0 - SLV) / N

(1.0 - 0.10) / 25.00 = 3.60%

b. FCCM Percent (%): = [(N-1)(1+SLV) + 2] x Discounted Money Rate / 2N

[(25.00 - 1)(1 + 0.10) + 2] x 6.500% / (2 x 25.00) = 3.69%

PART 31
CONTRACT COSTS PRINCIPLE AND PROCEDURES

SUBPART 31.1 -- APPLICABILITY

31.105 Construction and Architect-Engineer Contracts.

(d)(2)(i)(A) When the contracting officer cannot determine actual cost data for both ownership and operating costs for any piece of equipment or groups of similar serial or series equipment from the contractor's accounting records, ownership and operating costs for that equipment shall be determined in accordance with the Construction Equipment Ownership and Operating Expense Schedule published by the U.S. Army Corps of Engineers. The contracting officer shall insert the following statement in all solicitations and contracts for construction within the United States expected to exceed $25,000.

EQUIPMENT OWNERSHIP AND OPERATING EXPENSE SCHEDULE.

(a) Allowable cost for construction and marine plant and equipment in sound workable condition owned or controlled and furnished by a contractor or subcontractor at any tier shall be based on actual cost data for each piece of equipment or groups of similar serial and series for which the Government can determine both ownership and operating costs from the contractor's accounting records. When both ownership and operating costs cannot be determined for any piece of equipment or groups of similar serial or series equipment from the contractor's accounting records, costs for that equipment shall be based upon the applicable provisions of EP 1110-1-8, "Construction Equipment Ownership and Operating Expense Schedule," Region *. Working conditions shall be considered to be average for determining equipment rates using the schedule unless specified otherwise by the contracting officer. For equipment not included in the schedule, rates for comparable pieces of equipment may be used or a rate may be developed using the formula provided in the schedule. For forward pricing, the schedule in effect at the time of negotiations shall apply. For retrospective pricing, the schedule in effect at the time the work was performed shall apply.

(b) Equipment rental costs are allowable, subject to the provisions of FAR 31.105(d)(ii) and FAR 31.205-36 substantiated by certified copies of paid invoices. Rates for equipment rented from an organization under common control, lease-purchase or sale-leaseback arrangements will be determined using the schedule except that rental costs leased from an organization under common control that has an established practice of leasing the same or similar equipment to unaffiliated lessees are allowable. Costs for major repairs and overhaul are unallowable.

* Insert the Roman numeral for the appropriate region of the schedule.

APPENDIX A

SECTION III: EFAR REFERENCE (Continued)

31 July 1989 31.1-2

(c) When actual equipment costs are proposed and the total amount of the pricing action is over 25,000, cost or pricing data shall be submitted on Standard Form 1411, "Contract Pricing Proposal Cover Sheet." By submitting cost or pricing data, the contractor grants to the contracting officer or an authorizing representative the right to examine those books, records, documents and other supporting data that will permit evaluation of the proposed equipment costs. After price agreement the contractor shall certify that the equipment costs or pricing data submitted are accurate, complete and current. Insert the Roman numeral for the appropriate region of the schedule.

(d) This does not apply to terminations. See 49.113(100) and FAR Part 49.

APPENDIX G
TIRE LIFE AND TIRE WEAR FACTORS

SECTION I. TIRE WEAR FACTORS

The tire wear factors used in this pamphlet are listed in APPENDIX D. The "useful life" of a new tire is the product of Condition Factors (CF) from Group A through Group E multiplied by the Wheel Position Factor (WPF), and for drive tires only, the Grade Factor (GF). These factors provide a percentage reduction to the maximum tire life. Section II, Maximum Tire Life, states tire life in hours. See Chapter 2 for tire methodology.

Drive Tires: Useful Tire Life = (CF x WPF x GF)
All Other Tires: Useful Tire Life = (CF x WPF)

EXAMPLE *

* Condition Factors, Wheel Position Factors, and Grade Factor are from GMC Terex Guide.

Factors are specifically for a rear dump wagon.

Condition Factors (CF):		**Average**	**Severe**
A	Maintenance	1.00	1.00
B	Speeds	0.80	0.85
C	Curves	1.00	0.90
D	Surface Condition	0.90	0.70
E	Loads	0.90	0.80
CF	***Product of the factors (A x B x C x D x E)***	**0.65**	**0.43**

Wheel Position Factors (WPF):			
WPF-FT	Front Tire (FT)	0.90	0.90
WPF-DTR	Drive Tire (DT) - Rear Dump	0.70	0.70
WPF-TT	Trailing Tire (TT)	1.00	1.00

Grade Factor (GF):			
GF	Grade Factor (Drive Tires Only)	0.85	0.75

(continued next page)

APPENDIX G
TIRE LIFE AND TIRE WEAR FACTORS

SECTION I. TIRE WEAR FACTORS (continued)

EXAMPLE: FINAL TIRE WEAR FACTORS FOR WAGON, REAR DUMP
(See APPENDIX D, Category W15)

	Average	Severe
Front Tire - Average = (CF = .65)(WPF-FT = .90)	0.59	
Front Tire - Severe = (CF = .43)(WPF-FT = .90)		0.39
Drive Tire - Average = (CF = .65)(WPF-DTR = .70)(GF = .85)	0.39	
Drive Tire - Severe = (CF = .43)(WPF-DTR = .70)(GF = .75)		0.22
Trailing Tire - Average = (CF = .65) (WPF-TT = 1.00)	0.65	
Trailing Tire - Severe = (CF = .43) (WPF-TT = 1.00)		0.43

SECTION II. MAXIMUM TIRE LIFE

Maximum tire life is used in the formula to determine tire wear cost.

MAXIMUM TIRE LIFE	Hours
Bias Ply Tires - Off highway E4, L4, and L5	7,000
Bias Ply Tires - All other bias tires	5,000
Radial Ply Tires - Off highway RL4	8,300
Radial Ply Tires - All other radial tires	6,000
Conveyor Belts	5,000
